

1) RNN Classification

2) Simple NN cell vs RNN cell

3) Meaning of hidden units in NN & RNN

4) Multilayer in NN & RNN

5) CAPTURING long term dependencies by:

6) RUNNING Example (Simplest RNN Architecture) → LANGUAGE Model

Simple Neural Net Cell:

(BINARY
classes)

$$y = \sigma(w \cdot x + b)$$

σ : sigmoid function

With three inputs:

$x = [f, \text{Play}, \text{soccer}]$

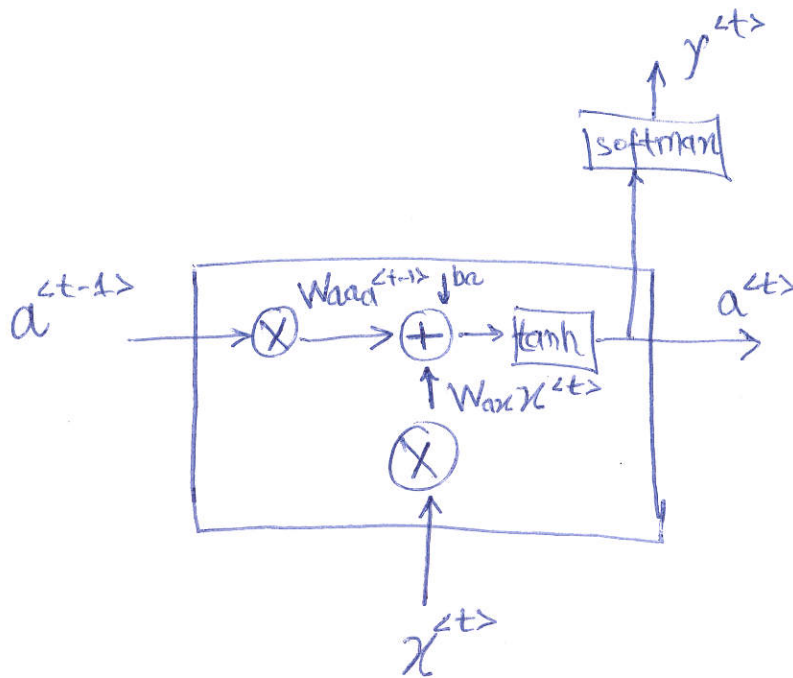

$y = [\text{game}, \text{no game}]$

$$y = \sigma(w_1x_1 + w_2x_2 + w_3x_3 + b)$$

RNN cell:

(Andrew Ng's lectures)

Inputs to cell:

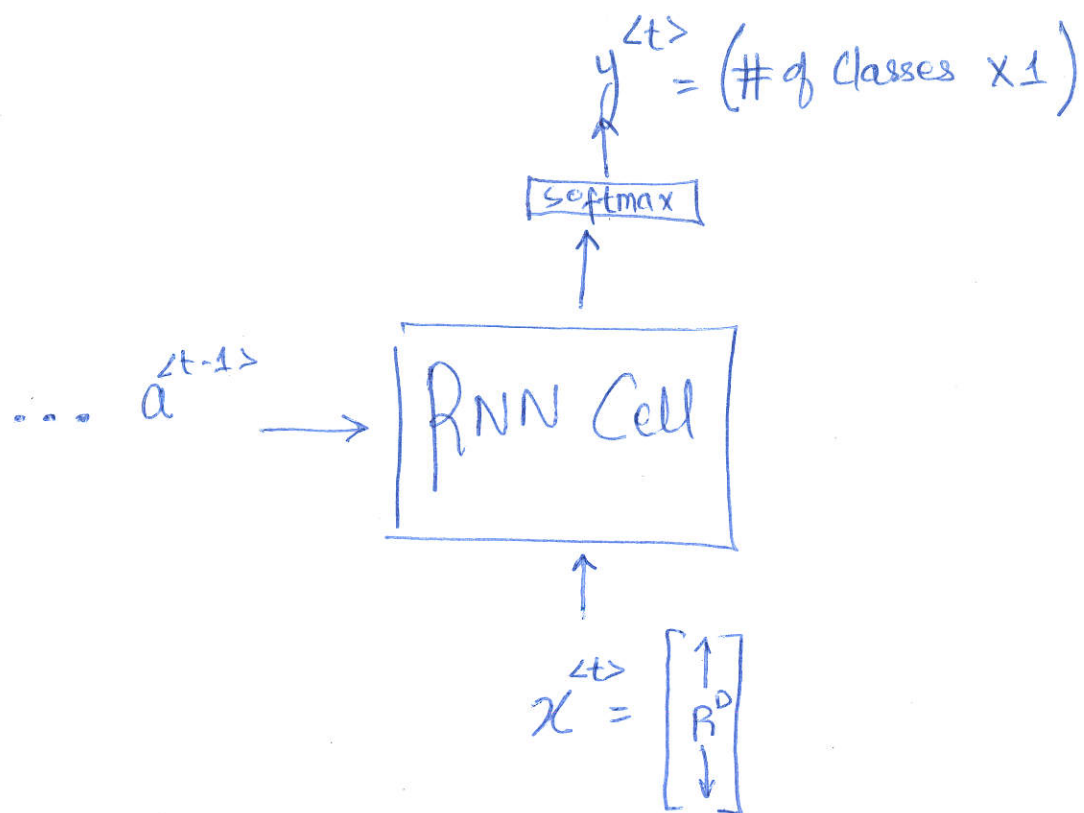

- 1) $a^{<t-1>}$ (Previous state)
- 2) $x^{<t>}$ (current input)

Output

- 1) $y^{<t>}$ (prob vector in general)

DIMENSION of $a^{<t>}$ Decides hidden units

EXAMPLE (NER)

TYPES of NN (ANDREJ KARPATHY)

4) ONE-to-ONE

②

ONE - to - MANY

④

MANY - to - MANY

(TRANSLATION)

③

MANY-to-ONE

(Sentiment Analysis)

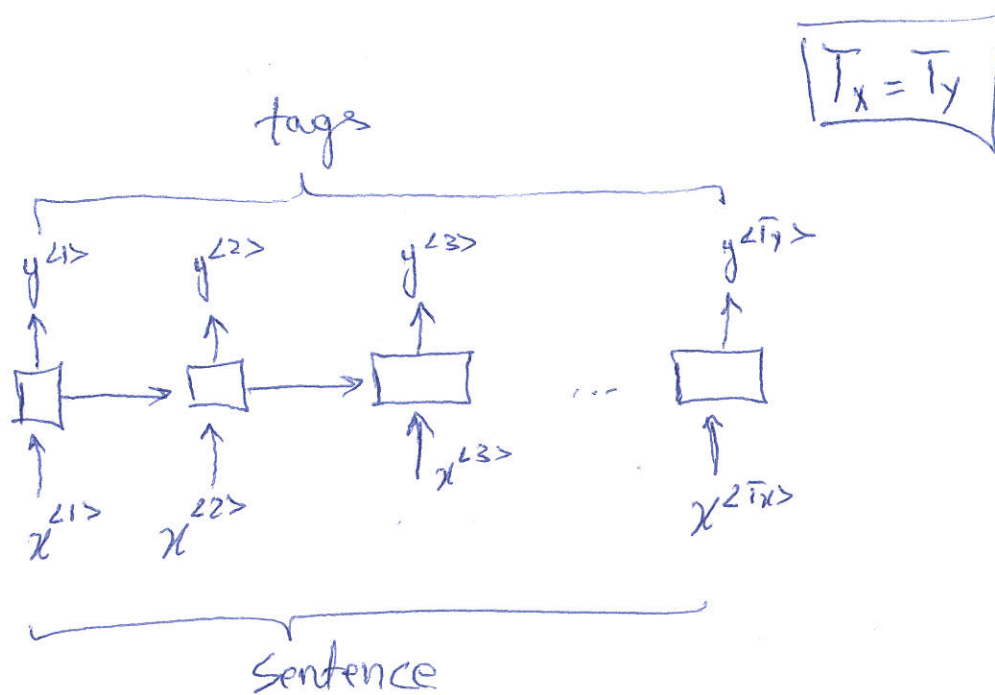

RNN cell can be replaced
By LSTM cell

5

MANY-2-NANY
